

Help the environment

By Alessandra Falasca & Ludovica Bertusi

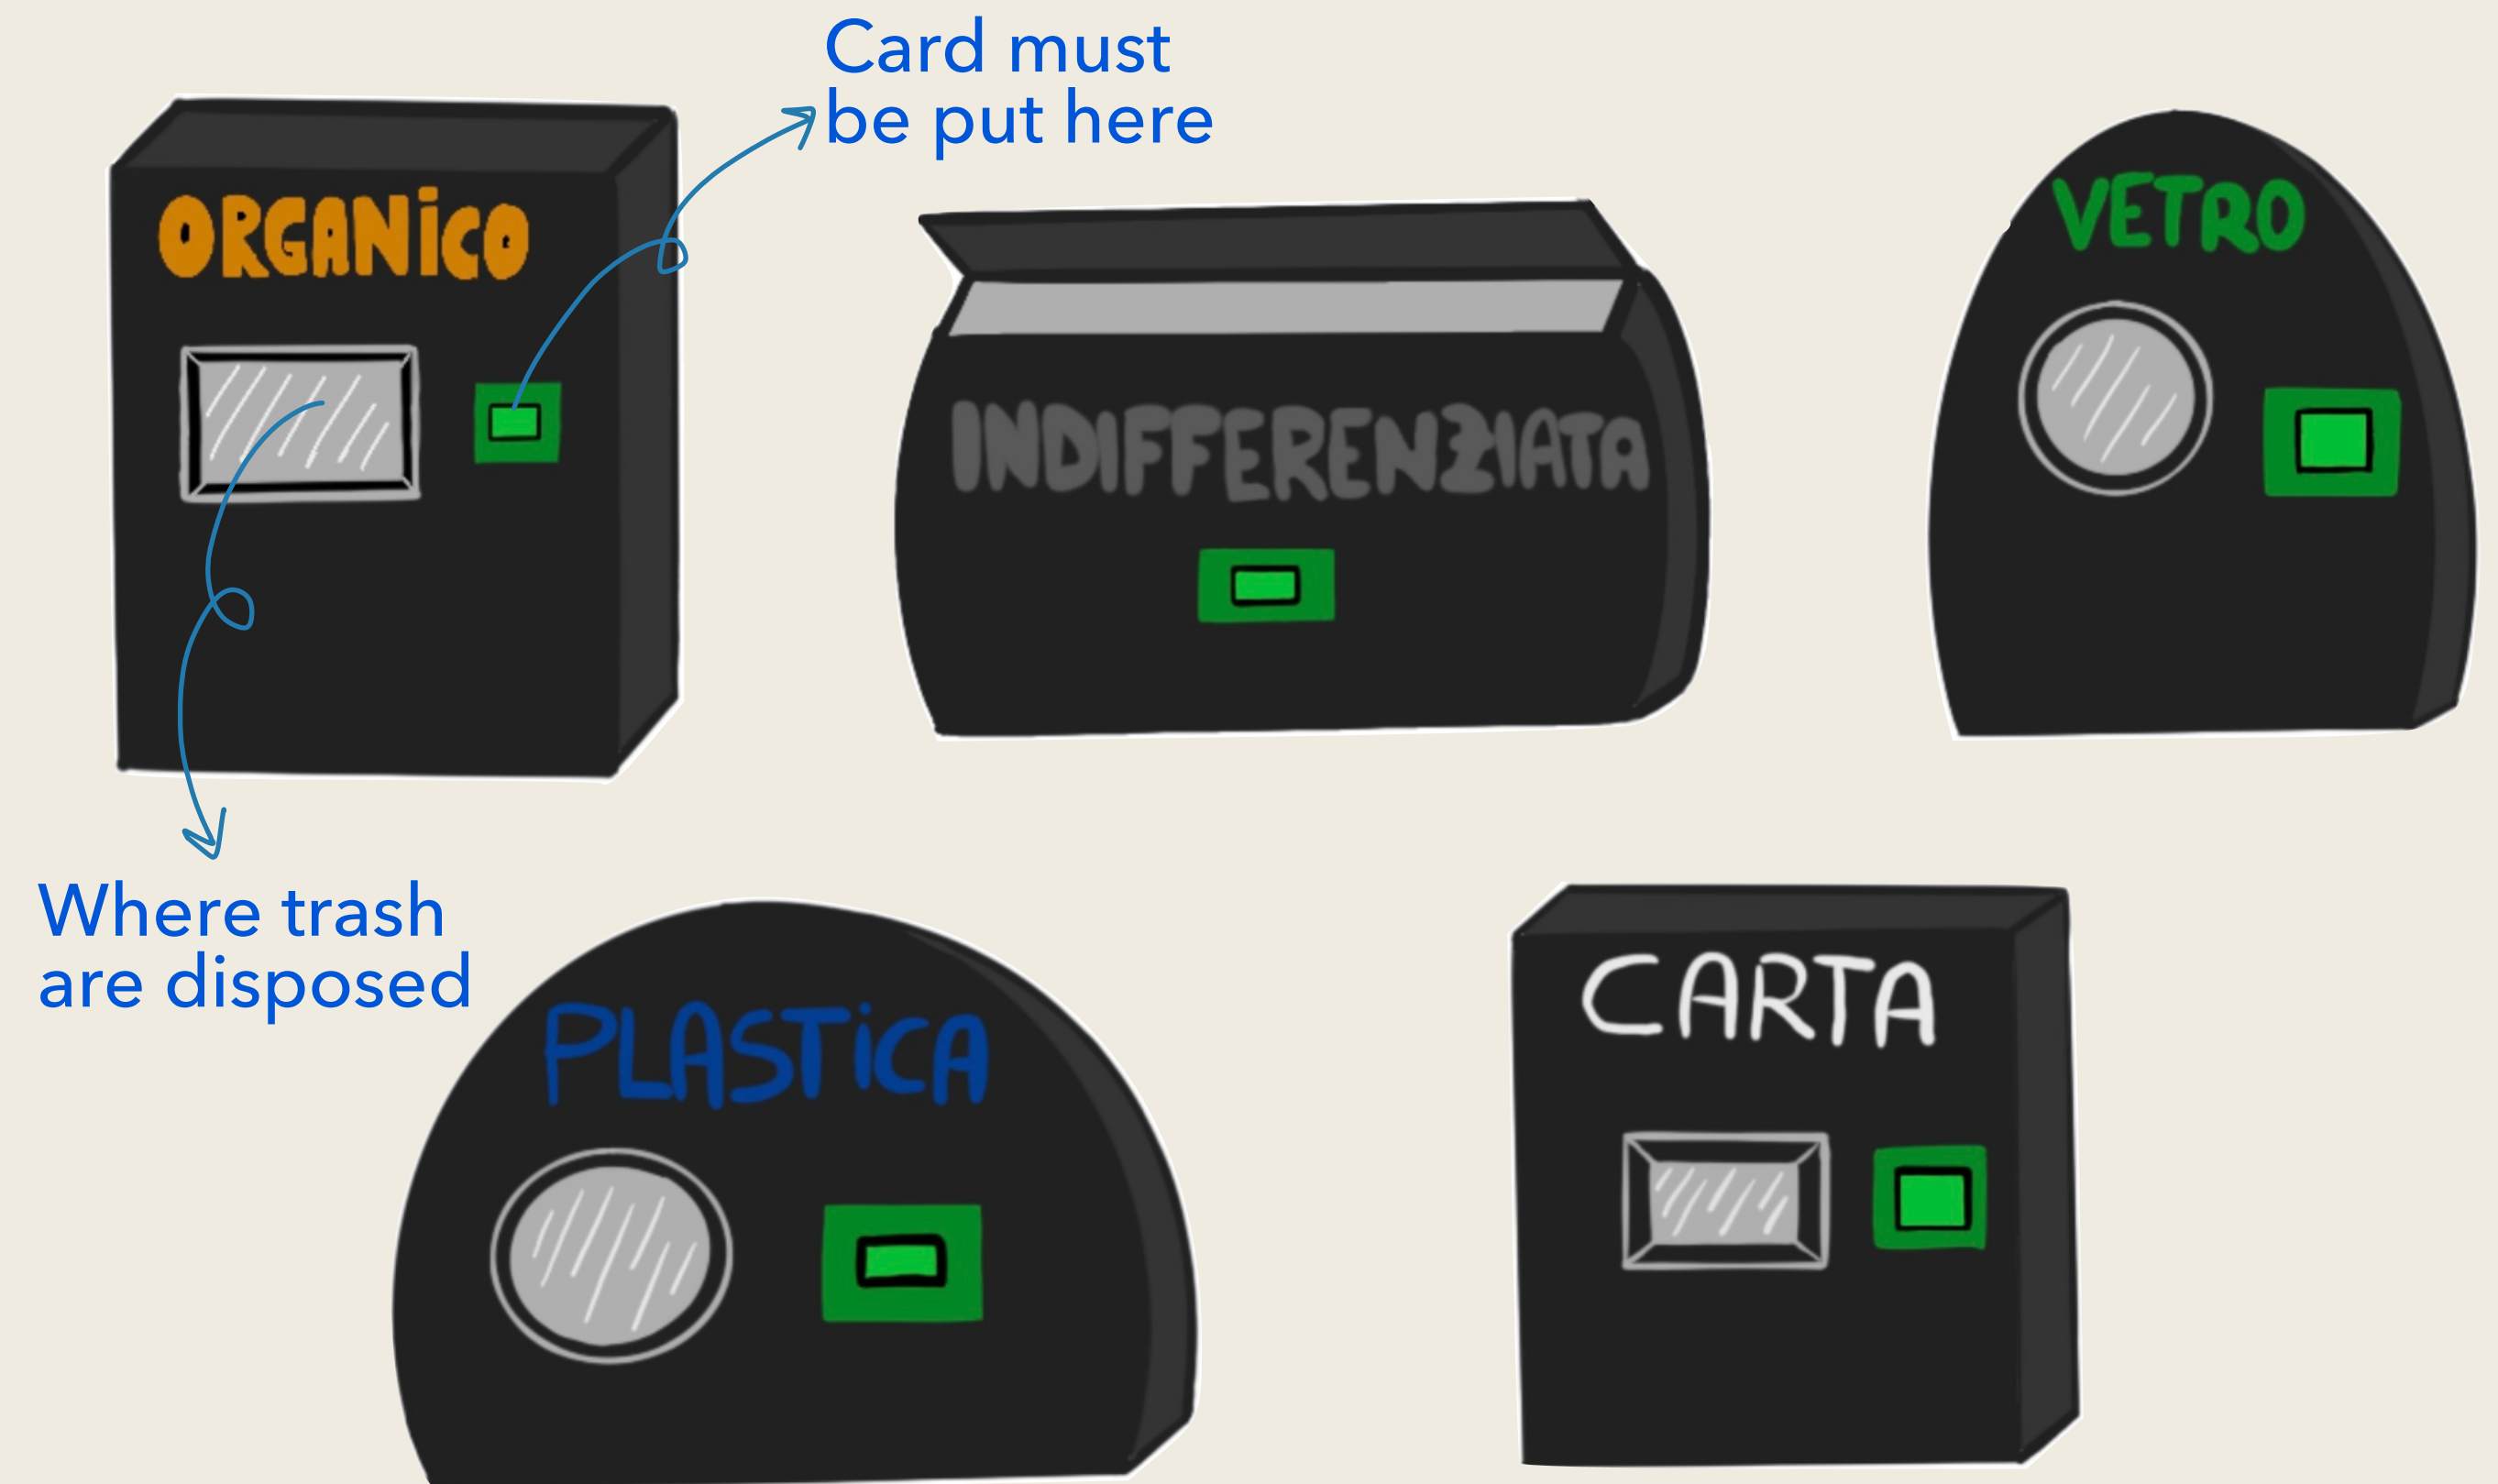

For a better waste disposal

This buckets are conceived to help the environment, and so they don't allow people to dispose wastes in an inappropriate way.

This new technological buckets can be used through a magnetic card, rechargeable online; with it you have to pay to recycle, in relation to how much garbage you recycle.

The most important aspect of this project is that if you want to recycle in an inappropriate way you can't, because there is a video surveillance system.

Another characteristic of this system is that all of these buckets have a low producing cost and are everywhere, there must be one per neighborhood.

All the buckets have different shapes because they have different needs

An alternative not to pollute the environment with toxic gases

The fiat 500's project

This project Made by Fiat 500 represents the car of the future because it doesn't produce toxic gases. Anyway there is a problem. FIAT 500 hasn't worried about the car batteries's disposal though they are a big problem. We thought that a special bucket could be put next to the others normal waste buckets, to recycle the batteries in a correct way.

Another problem could be how to charge the car, because there are few chargers. To solve this problem more chargers must be placed in streets, so minimum there must be a charger every gas station, no more than 500 meters away from it.
