

# **Earth Day's project**

## **Carlotta C. e Francesco M.**

# Introduction

- Carlotta and Francesco form the government and they need to create a plan to clean up Rome. In this period of quarantine we think about and understand the environmental problems and how to fix them. We noticed, in collaboration with an important International Science Institute , that staying at home for a long period without using our car could be the solution for the environmental problems.

# Problems

- Air pollution caused by petrol cars
- There aren't sufficient electric cars
- There are too few waste bins in the city
- People who don't have a car need public transport which is always late and “broken”

# How to solve these problems

- In order to fix the first problem, we would enact a decree which obliges citizens not to use their car on Monday and Friday unless it's electric
- The government will make electrical spots available . The people who can afford electric cars must have a charger in their garage to lend to those who can't afford it in the neighborhood.

- To limit pollution in general, we have decided to create pockets, inside women's bag, backpacks, pouches and jackets, that are water repellent and which do not allow the bad smells to come out. In this way you can store waste inside these bags instead of throwing it on the streets.

- To solve the fact that the buses are broken, we are creating an app which locates your payment for what concerns the transport, and if you don't upload your credit card the bill will arrive at your home and with that money we will buy newer buses. To fix the problem that buses are always late we will create exclusive rails for them; in this way you will no longer need drivers.
