

WILL OUR PLANET SURVIVE?

A video you may see
<https://youtu.be/VrzbRZn5Ed4>

The non-renewable sources

Coal- petroleum- methane-
Propane- ethane

They generate the **greenhouse effect**, what is it?

The renewables sources

Hydropower, geothermal power,
wind energy, and solar energy.

How have they helped the **environment**?

Goals of 2030 Agenda

2-6-7- 9- 11- 12- 13- 14- 15

What is the situation today?

Only 26% of all planet energy is renewable even if we now know what fossil fuels do to our planet.

Why isn't the situation changing?

Because the big companies that extract petrol and carbon gain loads of money from the sell of these (more or less 3.500\$ per second).

What are we doing to have a better future?

Many countries are trying to reduce their overall emissions, for example Italy started using renewable sources such as geothermal power or wind energy reducing our emissions by 22,48% compared to 1990 levels.
