

3 problems that destroy the environment

EARTH DAY

DEFORESTATION

Earth day

- Without plants no oxygen is produced, so we will die and life on the earth will extinct.
- Unfortunately, there is a huge business behind deforestation, which means that almost no-one cares about it
- To avoid this problem, we should start to grow up the more trees we can, so that deforestation is balanced with new shoots

POLLUTION, FOSSIL FUELS

EARTH DAY

- With the words fossils fuels we talk about all those materials, such as coal, which are used for chemical reactions.
- Nowadays we have a lot of clean renewable energy, which don't pollute and are infinite, like solar and wind power.
- The main issue is that renewable energies costs a lot and especially LEDCs can't afford to buy and use them, so they use coal, which pollutes and isn't renewable, but is cheap
- Unfortunately, there isn't anything that we can do to help LEDCs, apart from gift them some solar panels, but I don't think MEDCs will do it for free

CHEMICAL INDUSTRIES

EARTH DAY

- Chemical industries nowadays are essential, they produce lots of different stuff such as medicines.
- There's actually no problem with these industries and their works, but their chemical wastes, released in rivers and oceans destroy the aquatic environment and the aquatic life
- Obviously, we can't avoid the use of medicines, but I think that governments can write some articles or laws that forbid the release of this chemical substances in the environment, we have to find an efficient method to dispose of this wastes in a little period of time
