

The temperate zones have two different biomes
and everybody sees how beautiful they are does.
They are Divided in two biomes ,temperate forest and grasssland.
And With the influence of man they are coltivated land
Here I'm describing only good thing
Because with the bad ones
The information will hurt everyone
Our planet is in danger
and only now we are in a state of an anger ..
in north america many trees are deforested
Over the past 50 years the human tried to make this biomes our next home
But now we affected negatively the loam
With deforestation in North America we have left only 10 percent of temperate forest
And now more we demolish trees the closest generation
Will not saw this beauty around us
The American buffaloes are going to be extinct by the hunting
And if we destroy a species we are cutting
The food chain
And that will be a shame
The addition of deforestation,contributes in the loss of plant species, such as the coast
redwood,
which is now vulnerable to extinction
and it's not a fiction
with industrialization the rivers and lakes will be affected by the acidification.
Many acquatic species will die
And we are going to say goodbye
We need to wake up
And never give up
There's no planet B.
